Nebula SDK Reference

The Python and Java SDKs share the same retry contract. A retried create must carry the same idempotency key; otherwise the server treats it as a new request.

SDK version NEBULA-SDK-2.4.0 adds streaming cancellation and a bounded connection pool.

Configuration is read from a profile file, then overridden by environment variables.

Timeouts default to 30 seconds for search and 120 seconds for generation.

The SDK retries only 429 and 503 responses, and stops after three attempts.

Every error carries a request identifier that support can use to find the server-side trace.
